Ottawa, ON K1H 1E1

Attention: Tracy Hart, Ottawa District Manager

Dear Ms. Hart,

Re: 2021 Annual Report, Certificate of Property Use (CPU 0371-8TYQMY)
Lansdowne Park, Urban Park (Zone C)
450 Queen Elizabeth Drive (Part of 945 Bank Street),
Ottawa, Ontario

Pleased find enclosed one (1) digital copy of the 2021 Annual Report in accordance with the reporting requirements as identified in Section 4.2.10 of the Certificate of Property Use No. 0371-8TYQMY for Zone C, Urban Park, Lansdowne Park. A hard copy of the report can also be provided at your request.

Should you have any questions, please do not hesitate to contact me.

Best regards,

Richard Barker

Attention: Tracy Hart
Ottawa District Manager

Dear Ms. Hart;

RE: Report – 2021 Annual Report - Certificate of Property Use No. 0371-8TYQMY
Lansdowne Park- Urban Park (Zone C)
450 Queen Elizabeth Driveway (Part of 945 Bank Street), Ottawa, Ontario

Please find enclosed an electronic copy, in PDF format, of the 2021 Annual Report prepared in reference to the above noted property. The report has been prepared on behalf of the City of Ottawa to meet the annual reporting requirements stipulated under condition 4.2.10 of Certificate of Property Use No. 0371-8TYQMY.

Should you have any questions or require any additional information, please do not hesitate to contact the undersigned.

Sincerely,

Wood Environment & Infrastructure Solutions,
A Division of Wood Canada Limited

Kevin D. Hicks, M.Sc., P.Geo., QP_{ESA}
Principal Hydrogeologist

Executive Summary

Certificate of Property Use (CPU) No. 0371-8TYQMY was issued by the Ontario Ministry of Environment and Climate Change (MOECC), now the Ministry of Environment, Conservation and Parks (MECP), to the City of Ottawa (the "City") for the Lansdowne Park – Urban Park (Zone C) property located at 450 Queen Elizabeth Driveway (part of 945 Bank Street) in Ottawa, Ontario (hereinafter referred to as the "CPU Property") on November 25, 2013.

Condition 4.2.10 of the CPU stipulates that an annual report shall be prepared each year to document the activities carried out by the Owner in relation to the Risk Management Measures (RMM) that have been implemented and that are to be maintained at the CPU Property, and the report submitted to the MECP by March 31 of the following year. This report has been prepared by Wood Environment & Infrastructure Solutions, a Division of Wood Canada Limited ("Wood"), on behalf of the City of Ottawa (the "City") to meet the annual reporting requirements for 2021 as stipulated by Condition 4.2.10 of the CPU.

Inspections of the RMM implemented at the CPU Property were conducted in 2021 in accordance with the IMP. The geotechnical investigation which included areas of the East Berm required the advancement of boreholes through the clean soil cover of the East Berm and into the impacted soils beneath. Steps were taken prior to and throughout the drilling activities to protect the integrity of the clean soil cap and underlying geotextile demarcation layer. Once drilling activities were complete the clean soil cap and geotextile were restored to conform with specifications under the CPU.

Visual inspections undertaken in 2021 in other areas of the Site noted findings similar to those reported during previous inspections with respect to areas of bare soil in high traffic areas of the Site, stressed areas from temporary placement of equipment during entertainment events, as well as several areas of soil erosion identified throughout the South Berm as evidenced by surface rutting, areas of soil washout, bare patches, and areas of down slope sediment accumulation. The observed areas are not considered to result in any increase in the levels of risk to potential receptors at the CPU Property, however, reparations to these areas should be undertaken to prevent continued erosion due to loss of stabilizing vegetation in these areas.

The 2021 groundwater monitoring and sampling program was conducted on a semi-annual basis in accordance with the GWMP. Results of the groundwater monitoring inferred groundwater flow patterns beneath the CPU Property similar to those observed since inception of the groundwater monitoring program in 2015. Shallow groundwater, beneath the southern half of the CPU property, generally flows to the east and northeast in a quasi-inward radial flow pattern towards a groundwater low in the vicinity of the former McElroy Building. Mounding near the northeast corner of the CPU property results in localized outward radial flow to the west and south and is likely due to leakage from the Rideau Canal migrating to the west within the historic fill materials placed within the former inlet of the Rideau Canal that extends beneath the CPU Property.

All groundwater samples collected from the monitoring well network located at the CPU property in 2021 reported parameter concentrations below 2011 Table 3 SCS for residential / parkland / institutional property use and coarse textured soil, where established, and for ammonia, chloroform and iron, below the Property Specific Standards (PSS) derived from the Risk Assessment as provided in CPU 0371-8TYQMY.

Methane concentrations measured at the landfill gas probes located at the CPU Property in 2021 as per the MMP were below the methane concentrations limits as outlined in O.Reg. 232/98 and the recommended methane alert levels provided in Procedure D-4-1: Assessing Methane Hazards from Landfill (MOE, 1987).

No revisions were deemed necessary to the SMP or the HASP.

Based on the results of the GWMP, MMP and IMP completed in 2021, no contingency measures were deemed necessary at the CPU Property and therefore no such measures or activities were implemented in 2021. Routine inspections did not identify significant deterioration of the RMM that would result in an increase in potential risk to human health at the CPU property and therefore no immediate site restoration activities were deemed necessary at the CPU Property in 2021.

Based on the results of both monitoring programs to date, groundwater quality at the Site continues to meet applicable standards with only a few isolated exceptions reported early on in the program and methane generation is limited to within the limits of the former landfill and at concentrations that are also below applicable trigger criteria. It is Wood's opinion that the GWMP and MMP RMM are no longer required and a formal request to discontinue the programs was submitted to the MECP in 2021.

1.0 Introduction

On November 25, 2013 Certificate of Property Use (CPU) No. 0371-8TYQMY was issued by the Ontario Ministry of the Environment and Climate Change (MOECC), now the Ministry of the Environment, Conservation and Parks (MECP), for the Lansdowne Park – Urban Park (Zone C) property located at 450 Queen Elizabeth Driveway (part of 945 Bank Street) in Ottawa, Ontario (hereinafter referred to as the "CPU Property"). A key plan showing the location of the CPU Property is provided on Figure 1.

The CPU Property is legally described as Part of Lots 20, 21 and 22 (Block 6), Part of Lot 29 (Block 7) and Part of O'Connor Street (Formerly Mary Street) (closed by Judge's Order Instrument LT1245216) on Plan 26085, Part of Lots 57, 58, 59 and 60 and Part of Lansdowne Avenue (closed by Judge's Order Instrument LT1245216) on Plan 35722, Part of Lots 45 to 50 (Inclusive) on Plan 30307 and Part of Lots I and K, Concession C (Rideau Front), Nepean, being Parts 1, 16, 17, 32 and 33 on Plan 4R-26535; City Of Ottawa and being all of PIN 04139-0264.

Condition 4.2.10 of the CPU stipulates that an annual report shall be prepared each year to document the activities carried out by the Owner in relation to the Risk Management Measures (RMM) that have been implemented and are to be maintained at the CPU Property and submitted to the MECP by March 31 of the following year. This report has been prepared by Wood Environment & Infrastructure Solutions ("Wood"), on behalf of the City of Ottawa (the "City") to meet the annual reporting requirements stipulated by Condition 4.2.10 of CPU No. 0371-8TYQMY for 2021.

1.1 Background

Lansdowne Park, which also includes the former adjacent Sylvia Holden Commemorative Park, comprises an area of 15.64 hectares located on the east side of Bank Street in the Glebe neighbourhood of the City of Ottawa, Ontario. Lansdowne Park is bordered by Bank Street to the west, Holmwood Avenue to the north and Queen Elizabeth Driveway followed by the Rideau Canal to the east and south.

Lansdowne Park was a historic exhibition, sports and entertainment facility originally developed in the mid-1800s as an agricultural fairground. Through well over 100 years of continuous use the site has undergone numerous changes including both the site infrastructure and physiography.

In 2007 the City of Ottawa initiated a review to redevelop Lansdowne Park. The Ottawa Sports and Entertainment Group (OSEG) proposed a public-private partnership with the City to rebuild the stadium and redevelop Lansdowne Park. The redevelopment plan was initiated in 2012 and included three major components:

- Constructing a mixed-use area that includes retail, office, and residential property uses along the north and west portions of the site (Zone A);
- Refurbishing Frank Clair Stadium (sports stadium) / Civic Centre (arena complex) and re-locating and refurbishing the Horticultural Building (Zone B); and,

- Creating a large urban park along the east and south portions of the site (Zone C).

The CPU Property (i.e., Zone C) portion of the redevelopment was completed in the summer of 2015. A generalized site plan depicting the redeveloped Lansdowne Park is provided on Figure 2.

2.0 Certificate of Property Use

In recognition of the redevelopment to a more sensitive property use within Zone C, Wood (2012) submitted a Risk Assessment (RA) to the Environmental Assessment and Approvals Branch of the MECP on March 16, 2012 in support of the filing of a Record of Site Condition (RSC). The RA (3678-8JPR93) was accepted by the Director in its letter to the City of Ottawa dated April 20, 2012. In recognition of its acceptance of the RA for Zone C, CPU No. 0371-8TYQMY was issued by the MECP on November 25, 2013. CPU No. 0371-8TYQMY addresses the RMM to be implemented and maintained at the CPU Property to mitigate unacceptable risks to human health as described in the Risk Assessment (RA) and/or Part 4 of the CPU. The CPU also provides Property-Specific Standards (PSS) for specific contaminants of concern (COC) present in soil and groundwater beneath the CPU Property.

2.1 Risk Management Measures

The RMM to be implemented and maintained at the CPU Property are generalized as follows:

1. **Geotechnical Engineering:** Quality assurance and quality control for such earthworks as the placement and compaction of geotechnical materials and soils impacted by any COC shall be carried out by the representative of the geotechnical engineering firm responsible for the supervision of construction based on professional judgment.
2. **Former Eastern Landfill:** Construction of a non-woven geotextile marker horizon overlain by a combination soft soil and hard cap barrier, both extending 5 metres outward beyond the periphery of the former Eastern Landfill. The hard cap shall consist of approved structural elements. The soft soil cap shall include 0.5 to 1.5 metres of clean soil meeting the 2011 Table 3 Site Conditions Standards (SCS) for residential / parkland / institutional property use as provided in *Soil, Groundwater and Sediment Standards for Use under Part XV.1 of the Environmental Protection Act* (MOE, 2011a).
3. **East Berm:** Construction of an earthen berm to contain impacted soil excavated from Zone A. The berm shall be underlain by non-woven geotextile to demarcate the elevation above which impacted soils have been placed. The contoured surface of the impacted soils shall be covered with a non-woven geotextile to demarcate the zone of impacted soils present underneath and covered with a minimum of one metre of clean soil meeting the 2011 Table 3 SCS for residential / parkland / institutional property use and/or other approved structural elements.
4. **Former McElroy Building:** Construction of a non-woven geotextile marker horizon overlain by a combination soft soil and hard cap barrier over the east portion of the footprint of the Former McElroy Building. The hard cap shall consist of approved structural elements. The soft soil cap shall include 0.5 to 1.5 metres of clean soil meeting the 2011 Table 3 SCS for residential / parkland / institutional property use.
5. **Soil Management Plan:** Development and implementation of a Soil Management Plan (SMP) to establish best practices and procedures to mitigate adverse effects and potential exposure risks associated with the excavation, transportation, storage and handling of soil at the CPU Property. This includes earthworks undertaken during site redevelopment as well as during any post-development construction activities while the RMM are required to be maintained in place.

6. **Health and Safety Plan:** Development and implementation of a Health and Safety Plan (HASP) to provide guidance for the protection of workers from potential exposure to the COC known to be present at the CPU Property.
7. **Groundwater Monitoring Program:** Development and implementation of a Groundwater Monitoring Program (GWMP), for a minimum of five years, to identify any changes in the hydrological components and groundwater quality resulting from implementation of the risk management measures and establishing trigger levels and contingency activities in the event that the monitoring results show any concentration(s) greater than the PSS.
8. **Methane Monitoring Program:** Development and implementation of a Methane Monitoring Program (MMP), for a minimum of five years, to address the influence of seasonal variations on landfill gas concentrations in the vicinity of the former Eastern Landfill and related RMM and establishing trigger levels and contingency activities in case monitoring results show any concentration greater than the PSS that are or may be related to the production of landfill gas.
9. **Inspection and Maintenance Plan:** Development and implementation of an Inspection and Maintenance Plan (IMP) to assess the integrity of the RMM on a routine and as-needed basis and identify any depreciation or failure of the RMM requiring repair or reinstatement.
10. **Annual Report:** An annual report shall be submitted to the MECP by no later than March 31 of each year to document activities carried out by the Owner in relation to the RMM during the previous calendar year, including any activities in relation to: East Berm, former Eastern Landfill, Former McElroy Building, SMP, HASP, GWMP, MMP and IMP.

A copy of the CPU is available on request.

3.0 RMM Implementation

3.1 East and South Berm RMM

The construction of the East Berm was initiated in the summer of 2012 using impacted soil exceeding 2011 Table 3 SCS for residential / parkland / institutional property use excavated from within Zone A. The impacted soil was excavated concurrently with the areas excavated to construct underground parking structure located within Zones A and B. Following removal of the impacted soil a generic RSC was obtained for Zone A. COC present in soil excavated from within Zone A exceeding the applicable 2011 Table 3 SCS included various metals, polycyclic aromatic hydrocarbons (PAH) and petroleum hydrocarbons (PHC). Impacted soil which could not be accommodated in the East Berm were temporarily stockpiled within Zone C while awaiting placement in the South Berm, a western extension of the East Berm located south of the Stadium.

Construction of the South Berm began in the spring of 2013 using soil sourced from the temporary stockpile of impacted soil as well as non-impacted soil sourced from areas excavated to construct the underground parking structures. Impacted soil that could not be accommodated in the berms due to on-site temporary storage/stockpile limitations or other site logistics was transported and disposed off-site in accordance with applicable legislation.

While constructing the East and South Berms the following RMM were implemented:

- The existing ground surface beneath the berms was prepared by removing the existing asphalt where present, levelling and covering by eight-ounce non-woven geotextile fabric. The geotextile was placed to demarcate the interface between clean and impacted soil and to mitigate the potential for soil mixing.
- Soil known or suspected of being impacted was placed, compacted and contoured to a maximum elevation of at least 1 metre less than the final design elevation of the berms.
- Impacted soil contained within the East and South Berm was covered by eight-ounce non-woven geotextile fabric. The geotextile was installed per the manufacturer's instructions. At the toe of the berms, both the bottom and overlying geotextiles were placed in an anchor trench measuring 0.5 wide by 0.5 m deep. The anchor trench was then backfilled with clean sand. Based on a design slope of 3H:1V, the geotextile and impacted soil is set-back of approximately 2.56 metres from the toe of the berms.
- The geotextile overlying the impacted soil was covered with no less than 1 metre of clean fill (i.e., soil meeting *Table 3 Site Condition Standards in a Non-Potable Groundwater Condition - Residential/Parkland/Institutional Property Use*), which includes an upper layer of topsoil sufficient to support landscaping needs.
- In areas where trees were planted, sufficient soil depth was maintained around the rooting zones such that the roots of the mature trees would not have the potential for penetrating the underlying geotextile. At a minimum, trees were planted on compacted soil to prevent downward growth of

rootmass. No plant species with tap root systems were placed above or within 5 metres of any areas subject to soil capping.

- To ensure that migration of contaminants does not occur, utility trenches installed through the area of impacted soil contained within the berms were sealed with clay plugs at the transition from impacted to non-impacted soil. The clay seals were constructed to a minimum thickness of 100 cm and extended from the base of the utility trench to the sub-base.
- With respect to utility conduit materials, concrete or polyvinyl chloride (PVC) conduits are generally not affected by the COC at the site. Therefore, either concrete or PVC conduits were used as utility conduits at the site. Gaskets used to connect conduct pipe sections within the area of impact were composed of chemically resistant materials, such as nitrile or fluorocarbon.
- As-built surveys were made during construction of the berms to ensure compliance with the design requirements stipulated in the CPU and that the berms were constructed with the required minimum thicknesses of clean cover soil.
- The East and South Berms will be surveyed on an annual basis for two consecutive years following construction to assess any differential settlement or consolidation of materials that could result in unwanted thinning of the clean cover. The survey will note and record any areas showing evidence of erosion of surficial soil, slope failure and/or soil caving. Any areas subject to settlement greater than 0.10 metres will be subject to restoration using clean fill/topsoil. The first of these surveys was conducted in November of 2016 and the second was conducted in December of 2018.
- The as-built survey and annual settlement/consolidation surveys will be maintained by the City per Section 3.12 of the Risk Management Plan provided in Appendix I the Risk Assessment (AMEC, 2012).

In 2021, Wood conducted inspections of the RMM implemented in the area of the East and South Berms as part of the Inspection and Maintenance Plan developed for the Site to satisfy the requirements of Condition 4.2.8 of the CPU. Details of the inspections including photo logs are provided in the Risk Management Measures Inspection Logs in Appendix B. The extent of the RMM for the Berm areas is provided on Figure 3.

3.2 Former Eastern Landfill RMM

In addition to putrescible and non-putrescible waste, COC in soil requiring risk management in the area of the former Eastern Landfill include various metals, PAH and PHC. Based on the pre-construction grades, the zone impacted soil and/or waste extended from approximately 0.8 metres below ground surface to 4.8 mbgs. Potential risks were mitigated via capping the impacted soil and waste with a combination soft soil cap and hard cap. A non-woven geotextile was placed between the cap and the underlying impacted soil/waste to demarcate the transition between the two. Capping of the former Eastern Landfill was initiated in September 2013 and was conducted concurrently with the redevelopment construction activities. The capping was completed over several stages due to limited space availability during the construction works.

Utilities were installed prior to the installation of the overlying geotextile and capping materials. The extent of the former landfill was verified through visual inspection of deleterious materials in the soil and locating the physical limits of the former landfill observed as being the wood cribbing of the former inlet to the Rideau Canal. Final soft soil and hard caps placement over areas of the former Eastern Landfill was completed in the summer 2015. Excess impacted soil excavated during utility trenching and cap placement was transported and disposed off-site in accordance with applicable legislation.

The following RMM were implemented during the construction of the soft soil and hard caps over the former Eastern Landfill:

- The existing surface cover consisting of asphalt and granular subbase was removed to the required depth. The surface was contoured to accommodate the final design grades and placement of eight-ounce non-woven geotextile fabric. The geotextile was placed to demarcate the separation between underlying waste / impacted soil and the overlying soft soil and hard caps. The eight-ounce non-woven geotextile was extended a minimum of 5 metres beyond the limits of the former Eastern Landfill.
- The geotextile was capped with a soft soil cover consisting of clean soil (i.e., soil meeting *Table 3 Site Condition Standards in a Non-Potable Groundwater Condition - Residential/Parkland/Institutional Property Use*), a hard surface cap (i.e., asphalt, concrete or interlocking pavers and granular subbase), or a combination thereof. The thickness of the soft soil cap overlying the geotextile was determined based on landscaping needs but was not less than 500 millimetres inclusive of topsoil and grass sod. Examples of the different hard cap surface treatments include;
  - Concrete Unit Paving on Grade;
  - Granite Paving;
  - Reinforced and coloured asphalt paving;
  - Resilient Play Surface; and,
  - Refrigerated Concrete Slab for skating rink.
- Where features were constructed that penetrated the geotextile such as foundations for light standards or playground equipment, at the point of penetration, the geotextile was placed to extend 0.3 m up and around the penetration point.
- In areas where trees were planted, sufficient soil depth was maintained around the rooting zones such that the roots of the mature trees would not have the potential for penetrating the underlying geotextile. At a minimum, trees were planted on compacted soil to prevent downward growth of rootmass. No plant species with tap root systems were placed above or within 5 metres of any areas subject to soil capping.
- To ensure that migration of contaminants does not occur, utility trenches installed through the area of impacted soil contained within the berms were sealed with clay plugs at the transition from impacted to non-impacted soil. The clay seals were constructed to a minimum thickness of 100 cm and extended from the base of the utility trench to the sub-base.

- With respect to utility conduit materials, concrete or PVC conduits are generally not affected by the COC at the site. Therefore, either concrete or PVC conduits were used as utility conduits at the site. Gaskets used to connect conduct pipe sections within the area of impact were composed of chemically resistant materials, such as nitrile or fluorocarbon.
- The on-site storm water management system includes an underground stormwater retention tank encroaching the western limit of the former Eastern Landfill. The retention tank was installed such that the geotextile liner was placed along the side of the tank and secured in place with backfilled soil. Trenches for any storm sewers flowing into or out of the tank passing through the impacted soil were sealed as noted above. Soil excavated during the installation of the tank was managed as per the risk management plan.
- Once completed, the boundaries defined by the RMM developed for the former Eastern Landfill were surveyed. An as-built drawing will be maintained by the City as per the risk management plan.

In 2021, Wood conducted inspections of the RMM implemented in the area of the former Eastern Landfill as part of the Inspection and Maintenance Plan developed for the Site to satisfy the requirements of Condition 4.2.8 of the CPU. Details of the inspections including photo logs are provided in the Risk Management Measures Inspection Logs in Appendix B. The extent of the RMM for the former Eastern Landfill area is provided on Figure 3.

3.3 Former McElroy Building RMM

In the area of the former McElroy Building, COC requiring risk management included PAHs in soil. Contaminants in soil were managed via covering the impacted soil with non-woven geotextile that was overlain with a combination soft soil cap and hard cap (i.e., soil and paving structures and granular subbase). In October 2014 a test pit sampling program was completed to further delineate the extent of the PAH impacted soil. The extent of the RMM was based on the refined extent of the impacted soil.

The following RMM were implemented during the construction of the soft and/or hard cap over the Former McElroy Building:

- The existing surface cover consisting of asphalt and granular subbase was removed to the required depth. The surface was contoured to accommodate the final design grades and placement of eight-ounce non-woven geotextile fabric. The geotextile was placed to demarcate the separation between underlying waste / impacted soil and the overlying soft soil and hard caps. The eight-ounce non-woven geotextile was placed to extend a minimum of 5 metres beyond the limits of the define limits of the impacted soil.
- The geotextile was capped with a soft soil cover consisting of clean soil (i.e., soil meeting *Table 3 Site Condition Standards in a Non-Potable Groundwater Condition - Residential/Parkland/Institutional Property Use*), a hard surface cap (i.e., asphalt, concrete or interlocking pavers and granular subbase), or a combination thereof. The thickness of the soft soil cap overlying the geotextile was determined based on landscaping needs but was not less than 500 millimetres inclusive of topsoil and grass sod.

- Where features were constructed that penetrated the geotextile such as foundations for light standards, at the point of penetration, the geotextile was placed to extend 0.3 m up and around the penetration point.
- In areas where trees were planted, sufficient soil depth was maintained around the rooting zones such that the roots of the mature trees would not have the potential for penetrating the underlying geotextile. At a minimum, trees were planted on compacted soil to prevent downward growth of rootmass. No plant species with tap root systems were placed above or within 5 metres of any areas subject to soil capping.
- To ensure that migration of contaminants does not occur, utility trenches installed through the area of impacted soil contained within the berms were sealed with clay plugs at the transition from impacted to non-impacted soil. The clay seals were a minimum of 100 cm thick and extended from the base of the utility trench to the sub-base.
- With respect to utility conduit materials, concrete or PVC conduits are generally not affected by the COC at the site. Therefore, either concrete or PVC conduits were used as utility conduits at the site. Gaskets used to connect conduct pipe sections within the area of impact were composed of chemically resistant materials, such as nitrile or fluorocarbon.
- Once completed, the boundaries defined by the risk management measures developed for the McElroy Building were surveyed. An as-built drawing will be maintained by the City as per the risk management plan.

In 2021, Wood conducted inspections of the RMM implemented in the area of the former McElroy Building as part of the Inspection and Maintenance Plan developed for the Site to satisfy the requirements of Condition 4.2.8 of the CPU. Details of the inspections including photo logs are provided in the Risk Management Measures Inspection Logs in Appendix B. The extent of the RMM for the former McElroy Building area is provided on Figure 3.

4.0 Soil Management Plan

A SMP was developed in support of the Lansdowne Park redevelopment project in February 2012. The SMP was revised in May 2014 (AMEC, 2014a) to meet Condition 4.2.5 of the CPU. The objectives of the SMP for the RA RSC Property are as follows:

- Ensure that impacted soil and groundwater encountered during any earthworks are managed in compliance with all applicable environmental laws including a CPU specific to the RA RSC Property portion of the site. In this context, "impacted" soil is interpreted to mean soil that does not meet the standards for soil as laid out in the 2011 MOE document entitled "*Soil, Groundwater and Sediment Standards for Use under Part XV.1 of the Environmental Protection Act*", Table 3 Full Depth Generic SCS in a Non-Potable Groundwater Condition for Residential/Parkland/Institutional (R/P/I) Land Use, coarse soil type (2011 Table 3 SCS);
- Provide a process to manage impacted soil and/or groundwater, including any excess soil;
- Provide a contingency plan to identify and manage any unknown contamination identified during the construction process or produced due to a spill or release during construction;
- Support the execution of the site health and safety plan as it relates to the safety of the construction workforce and the neighbouring community where contamination is encountered;
- Outline the methodology and procedures to minimize dust created during the excavation, loading and importation, placement and compaction of soil;
- Outline the procedures for notification and reporting; and,
- Integrate into other management plans and procedures that could include quality, environmental management, emergency response, and sustainability.

The revised SMP to meet the requirements of Condition 4.2.5 of the CPU was submitted to the MECP on June 2, 2014. The SMP was included in contract documents and provided to contractors during the redevelopment project and Wood was retained by the City to ensure implementation of the SMP during construction works. No changes or amendments to the SMP were made in 2021.

5.0 Health and Safety Plan

The health and safety requirements mandated under the *Occupational Health and Safety Act* (OHSA), including the development and implementation of any Health and Safety Plan (HASP) is the responsibility of the Constructor deemed to be in charge of any works being undertaken at the site. This includes contractors retained by the owner working on its behalf. To assist contractors working at the CPU Property, a HASP addendum was developed to establish the health and safety requirements and provide guidance for the protection of workers from potential exposure to the COC known to be present at the CPU Property. The HASP addendum does not address other Health and Safety requirements.

The HASP addendum identifies the COC present at the CPU Property and the potential exposure pathways through which workers at the CPU Property may be exposed to those COC. Recommendations for personal protective equipment (PPE), personal hygiene and fugitive dust control are also provided in the addendum.

The HASP addendum was developed in July 2013 (AMEC, 2013). No changes or amendments to the HASP were made in 2021.

6.0 Inspection and Maintenance Plan

An IMP outlining the monitoring program to be implemented at the site to satisfy the requirements of Condition 4.2.8 of the CPU was submitted to the MECP on June 30, 2014 (AMEC, 2014b). The primary objectives of the IMP include, but are not necessarily limited to, addressing the following items:

1. Inspection and maintenance during construction activities;
2. Inspection frequencies and routine maintenance requirements for the non-woven geotextile, and for the final surfaces of each of the East Berm, the former Eastern Landfill and the Former McElroy Building;
3. Event-specific inspection and maintenance;
4. Weather-related inspection and maintenance, and,
5. Non-routine and incident inspection and maintenance.

In 2021 Wood conducted inspections, as per the IMP, of the RMM implemented at the CPU property including; prominent drainage features, the cap over the East Berm and its extension referred to as the South Berm as well as the cap over the former Eastern Landfill and former McElroy Building areas.

The following inspections were conducted in 2021:

1. May 19, 2021 – Routine spring inspection that included all RMM;
2. September 30, 2021 – Routine fall inspection, following the CityFolk music festival (September 16th-18th), the Bluesfest music festival (September 23rd-25th) and a rainfall event of 31.8 mm on September 22nd, that included all RMM; and,
3. October 25th through November 16th, 2021 – A total of 10 inspections were conducted during a geotechnical investigation which included the advancement of boreholes and instrumentation of groundwater monitoring wells in proximity to and within the limits of RMM implemented in the area of the East Berm. Inspections were conducted any time the planned work included disturbance of the RMM, namely the clean soil cap or the underlying geotextile demarcation layer.

Details of the inspections including photo logs are provided in the Risk Management Measures Inspection Logs in Appendix B.

Conditions observed during routine spring and fall 2021 inspections included small areas of bare soil and stressed vegetation primarily in high traffic areas around the ice rink and children's Garden/Skate Park as well as on top of the East Berm. The events held on the Great Lawn and south of the Water Plaza left areas of bare soil and stressed vegetation where temporary structures and equipment were placed. In addition, the majority of the South Berm continued to have areas of bare soil with evidence of soil erosion and transport. Observations were similar to those previously observed at the Site with no significant deterioration in 2021.

The geotechnical investigation was conducted by Paterson Group Inc. ("Paterson") and included the advancement of seven (7) boreholes in the vicinity of the East Berm, four (4) of which were advanced through the clean soil cap and geotextile overlying the East Berm. Two (2) borehole locations were instrumented with groundwater monitoring wells including one (1) location within the East Berm footprint. A plan depicting the borehole and groundwater monitoring well locations is provided in the RMM inspection report in Appendix B. Proposed borehole locations were sub-excavated through the clean soil cap and down to the geotextile on October 26, 2021, using a mini excavator. Once the geotextile at the base of the clean soil cap was exposed, it was cut and pulled back to provide an area to drill through the cap without damaging the geotextile. Once the geotextile was pulled back, the centre of the hole was marked using a stake and the excavation backfilled with the clean soil stockpiled from the excavation in order to allow the drilling contractors to safely work around the borehole locations.

Boreholes located on the East Berm were advanced by George Downing Estate Drilling Ltd. ("Downing") between October 26th and November 12th, 2021. Boreholes were advanced through the clean soil cap into the underlying impacted soils. Drilling operations through the clean soil cap and geotextile were monitored closely in order to ensure the auger did not disturb the geotextile. Paterson was informed that soil beneath the geotextile layer was to be treated as contaminated soil. Any excess drill cuttings from beneath the geotextile layer were to be segregated and placed in drums to be disposed of at a licensed landfill.

Following the drilling activities, reinstatement of the clean soil cap and geotextile was completed by Paterson on November 16th, 2021. Reinstatement activities included re-excavating the borehole areas down to the geotextile using a mini excavator to expose the geotextile, folding the geotextile back down and then placing a patch of new geotextile over the cuts in the existing geotextile. The specifications of the geotextile used to patch the holes was verified and met the requirements of the CPU. In locations where a groundwater monitoring well was installed, the geotextile was brought up and around the well's protective casing. Once the geotextile was patched the hole was backfilled with the clean soil removed to expose the geotextile. Reinstatement of the clean soil cap and geotextile conformed with specifications under the CPU.

There was no significant deterioration of the RMM that would result in an increase in potential risk to human health on the CPU property observed during any of the inspections conducted in 2021 and therefore no immediate actions were recommended throughout the year. No changes or amendments to the IMP were made in 2021.

7.0 Groundwater Monitoring Program

A proposed GWMP outlining the proposed monitoring program to satisfy the requirements of Condition 4.2.7 of the CPU was submitted to the MECP for its approval on September 2, 2014 (AMEC, 2014c). Communication from the MECP indicating that the City should proceed with the GWMP was provided in its letter to the City dated March 20, 2015. The primary objectives of the GWMP include, but are not necessarily limited to, addressing the following:

1. Identifying changes in the hydrological components having a direct interaction with the CPU Property soils including well water levels, groundwater flow details, infiltration rates and interflow details;
2. Identifying any changes in groundwater quality resulting from establishing the RMM;
3. Establishing the location and installation details of all groundwater monitoring wells to be included in the program;
4. Establishing the frequency of all groundwater sampling and monitoring events;
5. Establishing an itemized list of chemical parameters to be analyzed at each monitoring well location, including those identified in Schedule 5, Column 2 – Indicator List for Groundwater and Leachate contained in the Landfill Standards: A Guideline on the Regulatory and Approval Requirements for New or Expanding Landfilling Sites (PIBS 7792e) published by the MOE and dated January 2012, as it may be amended from time to time; and,
6. Establishing trigger levels and contingency activities in the event that the monitoring results show any concentration(s) greater than the PSS.

7.1 Groundwater Monitoring Well Construction

As per the GWMP, a total of twelve (12) monitoring wells (MW15-1 to MW15-12) were installed at strategic locations to facilitate monitoring and sampling of the near surface groundwater beneath the CPU Property. As the GWMP was designed to detect changes to both physical flow characteristics and groundwater quality, the monitoring well locations were selected in consideration of the groundwater flow patterns previously identified at the Site and the proposed locations of the RMM implemented at the Site. Monitoring locations were therefore established both upgradient and downgradient of the RMM as well as within the immediate areas of the RMM. The groundwater monitoring well locations are shown on Figure 4.

The groundwater monitoring well construction details are summarized in Table 1. Monitoring wells were constructed by Strata Drilling Group from October 21 to 23, 2015 in accordance with the monitoring well construction details provided in the GWMP. Details of the borehole drilling and monitoring well installations are shown on the stratigraphic and instrumentation logs provided in Appendix C.

All groundwater monitoring wells installed at the Site were instrumented with dedicated Waterra inertial lift pumps and sufficient lengths of 12 mm inside diameter low density polyethylene (LDPE) tubing to

facilitate well development and purging requirements. Following a minimum period of 48 hours after installation, each monitoring well was developed by extracting approximately five to ten well volumes to remove any residual sediment and/or drill cuttings introduced during the borehole drilling and well installation process, stabilize and grade the filter pack, improve connectivity between the well and the formation, and restore groundwater that may have been disturbed or otherwise altered during the drilling and well installation process. Once developed, the wells were instrumented with 6 mm inside diameter LDPE tubing to facilitate low-flow sampling using a peristaltic pump.

7.2 Groundwater Monitoring and Sampling

Groundwater monitoring was conducted on May 27th, 2021 and December 1st, 2021 and included all twelve (12) monitoring wells installed at the CPU Property. In addition to these monitoring wells, five (5) monitoring wells located on the National Capital Commission (NCC) property to the immediate east were also monitored during the May 27th and December 1st monitoring events. The locations of the NCC monitoring wells are shown on Figure 4 and their construction details provided in Table 1.

The depths to groundwater and the static groundwater elevations recorded at the monitoring wells are summarized in Table 2. In the spring, groundwater was present at depths ranging from 3.123 metres below ground surface (mbgs) at MW15-1 to 6.028 mbgs at MW15-2. Water table elevations recorded at the monitoring wells varied between 59.200 metres above sea level (masl) at MW15-2 and 62.369 masl at MW15-1. A groundwater elevation contour plan for the May 27, 2021 monitoring event depicting the inferred groundwater flow pattern beneath the CPU Property is provided on Figure 5a.

In the fall, groundwater was present at depths ranging from 3.298 mbgs at MW09-3 to 5.864 mbgs at MW15-12. Water table elevations recorded at the monitoring wells varied between 59.497 masl at MW09-5 and 62.164 masl at MW09-1. A groundwater elevation contour plan for the December 1, 2021 monitoring event depicting the inferred groundwater flow pattern beneath the CPU Property is provided on Figure 5b.

The inferred groundwater flow patterns beneath the CPU Property observed during the spring and fall monitoring events are generally similar to those observed during previous monitoring events conducted since inception in 2015. Shallow groundwater beneath the southern half of the CPU property generally flows to the east and northeast in a quasi-inward radial flow pattern to a groundwater low located in the vicinity of the former McElroy Building. Mounding near the northeast corner of the CPU property results in localized outward radial flow to the west and south and is likely due to water originating from the portion of the Rideau Canal located north of the Site migrating within the fill materials placed within the reclaimed former inlet of the Rideau Canal.

Groundwater samples were collected on May 28 and 31, 2021 during the spring sampling event and on December 2, 8, 13 and 14, 2021 during the fall sampling event. Groundwater samples were collected from each of the monitoring wells installed at the CPU Property, with the exception of MW15-4, MW15-6 and MW15-10 during the spring sampling event due to insufficient water in the wells.

Groundwater samples were collected using low-flow sampling techniques in order to minimize potential sample biasing due to sediment entrainment. Groundwater field parameters measured during sampling including pH, temperature, dissolved oxygen (DO), conductivity and oxidation-reduction potential (ORP) and general observations made during sampling are provided in Table 3. Each of the groundwater samples collected was analyzed for the following COC: PAH, PHC F1 - F4, chloroform, metals and landfill leachate indicator parameters as identified in Schedule 5, Column 2 – Indicator List for Groundwater and Leachate contained in the *Landfill Standards: A Guideline on the Regulatory and Approval Requirements for New or Expanding Landfilling Sites* (PIBS 7792e) including alkalinity, ammonia, calcium, chloride, conductivity, iron, magnesium, nitrate (as N), pH, sodium, total dissolved solids (TDS), sulphate, biochemical oxygen demand (BOD), chemical oxygen demand (COD), dissolved organic carbon (DOC). Samples collected for metals analysis were field filtered using 0.45 µm disposable filter capsules. With the exception of chloride, 2011 Table 3 SCS do not exist for these landfill indicator parameters. A PSS was developed for ammonia as it was identified as a COC resulting from former ice making plants at the former Curl-o-Drome and former McElroy Building. These parameters have been analyzed to facilitate the identification of any trends which may be indicative of the deterioration of groundwater quality resulting from the implementation of the RMM.

One (1) blind duplicate sample was collected during the spring event while two (2) were collected in the fall for analysis of one or more COC including PAHs, PHC F1-F4, chloroform, metals, and landfill leachate indicator parameters for quality assurance / quality control (QA/QC) purposes. Sample DUP-1 is a blind duplicate sample of MW15-12 for the spring sampling event and samples DUP-1 and DUP-2 are blind duplicate samples of MW15-1 and MW15-7, respectively, for the fall sampling event. Two (2) trip blanks were used during both the spring and fall sampling events, for analysis of chloroform and/or PHC F1 to assess potential cross contamination during sample storage and transport.

7.3 Groundwater Sample Analysis

Groundwater sample analyses were performed by Paracel Laboratories Ltd. of Ottawa, Ontario under contract to the City of Ottawa =. Analytical results for groundwater samples collected from the monitoring wells located on the CPU Property were evaluated through comparison with the 2011 Table 3 SCS for residential / parkland / institutional property use and coarse textured soil, where established, and for ammonia, chloroform and iron, to the PSS derived from the Risk Assessment as provided in CPU 0371-8TYQMY.

The MECP recently released the document entitled *Guidance for Addressing Chloroform at a Record of Site Condition Property* ("Chloroform Guidance"). The purpose of the document is to provide guidance which can be used by Qualified Persons (QP) and property owners where an RSC is being sought under *Ontario Regulation 153/04 – Records of Site Condition, as amended* ("O.Reg. 153/04") at a property and when addressing chloroform in soil and/or groundwater where the source of the chloroform is from a treated municipal water supply.

The Chloroform Guidance states that if two criteria can be met and documented in the Conceptual Site Model (CSM) as part of a RA and/or RSC submission, then the applicable SCS for chloroform need not be considered to be exceeded. The two criteria are:

1. The source of chloroform is only associated with water from a treated municipal water supply; and,
2. All soil and groundwater concentrations are numerically equal to or lower than the values listed in Table A of this guidance.

As the chloroform groundwater impacts identified beneath the CPU Property were attributed to leaking municipal infrastructure, the groundwater value for chloroform provided in Table A of the Chloroform Guidance was adopted for the CPU property replacing the Table 3 SCS. The groundwater value for chloroform for non-potable groundwater situations, residential / parkland / institutional property use, and coarse textured soil is 240 µg/L.

O.Reg. 153/04 was subject to various amendments via O.Reg. 407/19 filed on December 4, 2019. Section 49.1 was amended to include provisions to address certain exceedances of applicable site conditions standards at a property. One such provision was provided for chloroform, whereby if the qualified person has determined, based on a phase one environmental site assessment or a phase two environmental site assessment, that there has been a discharge of drinking water within the meaning of the Safe Drinking Water Act, 2002, then the applicable site condition standard is deemed not to be exceeded for the purpose of Part XV.1 of the Act.

The results of the spring and fall groundwater sample analyses, and their respective 2011 Table 3 SCS and PSS derived from the Risk Assessment are summarized in Table 4a and 4b respectively.

Copies of the Certificates of Analysis issued by the laboratory are provided in Appendix D.

7.3.1 Spring Monitoring Event

Ten (10) groundwater samples, including one (1) blind QA/QC duplicate sample, were collected from on-Site monitoring wells in the spring on May 28th and 31st. Samples could not be collected from MW15-4, MW15-6 and MW15-10 due to insufficient water in the wells. The results of the analysis are summarized in Table 4a.

7.3.1.1 Petroleum Hydrocarbons

PHC were not detected in any of the groundwater samples. Based on the analytical method detection limits (MDL) reported by the laboratory, all samples are deemed to be below the applicable 2011 Table 3 SCS.

7.3.1.2 Chloroform

Chloroform was detected in groundwater samples collected from two (2) monitoring wells located on the CPU Property including MW15-2 and MW15-3 at reported concentrations of 1.9 µg/L and 1.1 µg/L, respectively. These concentrations are below the PSS value of 22 µg/L and well below the applicable Table A Chloroform Guidance value of 240 µg/L. All other groundwater samples collected reported concentrations of chloroform below analytical MDL, and therefore below the PSS and Table A Chloroform Guidance value.

7.3.1.3 Polynuclear Aromatic Hydrocarbons

Up to eleven (11) PAHs, including acenaphthylene, anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, chrysene, fluoranthene, indeno(1,2,3,c,d)pyrene, phenanthrene and pyrene were detected in groundwater samples collected from monitoring wells MW15-3 and MW15-8 located on the CPU property. The concentrations reported for the eleven (11) PAH parameters were below their respective 2011 Table 3 SCS. Samples reporting PAH concentrations below MDL are deemed to be below the applicable 2011 Table 3 SCS based on the MDL reported by the laboratory.

7.3.1.4 Metals

Up to fifteen (15) metals including six (6) or more of barium, boron, calcium, cobalt, copper, iron, lead, magnesium, molybdenum, nickel, selenium, silver, sodium, uranium, and zinc were detected in each of the groundwater samples. All groundwater samples collected reported metals concentrations below their respective 2011 Table 3 SCS where established or the PSS for iron.

7.3.1.5 General Chemistry Parameters

None of the general chemistry parameters exceeded their 2011 Table 3 SCS or PSS, where established, during the spring monitoring event.

7.3.2 Fall Monitoring Event

Fourteen (14) groundwater samples, including two blind QA/QC duplicate sample, were collected from on-Site monitoring wells in the fall on December 2nd, 8th, 13th, and 14th, 2021. The results of the analysis are summarized in Table 4b.

7.3.2.1 Petroleum Hydrocarbons

PHC were not detected in any of the groundwater samples. Based on the analytical MDL reported by the laboratory, all samples are deemed to be below the applicable 2011 Table 3 SCS.

7.3.2.2 Chloroform

Chloroform was detected in groundwater samples collected from two (2) monitoring wells located on the CPU Property including MW15-2 and MW15-3 at reported concentrations of 2.6 µg/L and 1.3 µg/L, respectively. These concentrations are below the PSS value of 22 µg/L and well below the applicable Table A Chloroform Guidance value of 240 µg/L. All other groundwater samples collected reported concentrations of chloroform below analytical MDL, and therefore below the PSS and Table A Chloroform Guidance value.

7.3.2.3 Polynuclear Aromatic Hydrocarbons

Up to fourteen (14) PAHs, including acenaphthylene, anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(g,h,i)perylene, chrysene, fluoranthene, fluorene, indeno(1,2,3,c,d)pyrene, 1-methylnaphthalene, 2-methylnaphthalene, naphthalene, phenanthrene and pyrene, were detected in groundwater samples collected from monitoring well MW15-3. The concentrations for the reported PAHs were all below their applicable 2011 Table 3 SCS. All other PAHs reported during the fall monitoring event reported concentrations below MDL. Concentrations below MDL are deemed to be below the applicable 2011 Table 3 SCS based on the MDL reported by the laboratory.

7.3.2.4 Metals

Up to sixteen (16) metals including six (6) or more of barium, boron, calcium, cobalt, copper, iron, lead, magnesium, molybdenum, nickel, selenium, silver, sodium, uranium, vanadium and zinc were detected in each of the groundwater samples. All groundwater samples collected reported metals concentrations below their respective 2011 Table 3 SCS where established or the PSS for iron.

7.3.2.5 General Chemistry Parameters

None of the general chemistry parameters exceeded their 2011 Table 3 SCS or PSS, where established, during the fall monitoring event.

7.4 Field Quality Assurance Program

The field QA/QC program was implemented to minimize and quantify sample biasing introduced during sample collection, handling, shipping and analysis and ensure the integrity of the groundwater, soil and soil vapour sampling and analytical testing results. Sampling protocols included use of standardized field procedures (e.g., minimizing sample handling, use of field QA/QC samples, using dedicated non-contaminating sampling equipment, using unique sample-specific identification procedures, using chain-of-custody records) and recognized laboratory analytical methods and procedures.

In addition to the protocols and measures cited above, the field quality assurance program included the use of field duplicates and trip blanks. Blind duplicate samples were collected at the rate of one (1) duplicate samples for every ten (10) samples (i.e., 10%). In some cases, less than 10% soil duplicate

samples were collected due to poor soil recovery during drilling. Trips blanks were employed at a rate of one trip blank for each sample cooler shipped containing volatile analytes (e.g., VOC and/or PHC F1).

7.4.1 Field Duplicates

Field duplicates consist of samples collected at the same time and location placed into separate containers and are submitted for laboratory analysis to evaluate laboratory precision and field sampling and handling procedures, as well as to assess potential sample heterogeneity. For water samples, duplicates are prepared by alternately filling the sample bottles. The relative percent difference (RPD) is defined as the absolute value of the variation between a sample and its duplicate, when compared to the average concentration of the original and the duplicate. It is used to assess the validity of the field and laboratory analytical procedures. Meaningful RPDs can only be calculated if concentrations of a parameter are greater than the analytical MDL in both the primary and duplicate samples. Lower precision in the RPD calculation is expected when concentrations are less than five (5) times the MDL.

The results of the groundwater field duplicate sample analyses indicate that the sampling results are generally reproducible. In most cases RPDs for the primary and duplicate samples could not be calculated as results were either below MDL or were less than fine times the reported MDL and thus not considered statistically significant. Where RPD was calculated values were within the acceptable limits, with the exception of ammonia in the primary sample and its duplicate collected from MW15-5 in the fall. Duplicate samples consist of discrete samples collected independent of one another. As such, the observed discrepancies, while relatively minor, may represent some variability with regards to ammonia; however, all other parameters from this location were within acceptable limits.

7.4.2 Trip Blanks

Trip blanks, also known as travel blanks, are employed to assess potential cross contamination of volatile organic compounds from other samples, ambient conditions, or other sources during sample storage and shipment prior to receipt at the laboratory. Trip blanks consist of analyte free media (soil or water) prepared and placed in the sample storage and shipping cooler by the laboratory, taken to the site, and returned unopened to the laboratory with the sample submission.

Trip blanks employed during the spring and fall sampling programs reported non-detect concentrations for chloroform. PHC F1 was not detected in either trip blank in the spring and was not analyzed for either trip blanks in the fall. PHC F1 has not been detected in any of the wells since sampling began in 2015.

7.5 Laboratory QA/QC Program

7.5.1 Laboratory Accreditation

The analytical laboratory employed to perform the laboratory analyses (Paracel) is accredited by the Canadian Association for Laboratory Accreditation Inc. (CALA) in accordance with ISO/IEC 17025:2017– *General Requirements for the Competence of Testing and Calibration Laboratories* for the tested

parameters set out in the *Soil, Ground Water and Sediment Standards for Use under Part XV.1 of the Environmental Protection Act* dated 15 April 2011.

7.5.2 Performance Criteria

The *Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act* (the "Analytical Protocol"), dated March 9, 2004 (amended as of July 1, 2011), establishes performance criteria for use when assessing the reliability of data reported by analytical laboratories. These include maximum hold times for the storage of samples/sample extracts between collection and analysis, specified/approved analytical methods, required field and/or laboratory quality assurance samples such as blanks and field and laboratory duplicates, specified recovery ranges for spiked samples and surrogates (compounds added to samples in known concentrations for calibration purposes), Reporting Limits (RL) and specified precision required when analyzing laboratory duplicate and spike/controlled reference material samples.

7.5.3 Laboratory Data Validation

Sample analysis dates provided on the reports of analysis issued by Paracel indicate that all sample analyses were performed within the required sample/extract hold times. The RLs were met for all tested parameters.

Laboratory Blank Samples

Laboratory blank samples include method blanks and blank spikes. Method blanks consist of an uncontaminated media sample which is free of the target analytes or any other parameters that may interfere with the analysis and are subject to the entire analytical procedure including extraction, digestion, or any other preparation procedure. Method blanks are used to monitor laboratory background level of the target analytes and laboratory artefacts or anomalies. Method blanks are also used to monitor cross contamination of carry-over between samples, notable when high concentrations of the target analytes are present.

Blank spikes consist of an uncontaminated media sample free of the target analytes or interferences which is fortified with a known concentration of target analytes. The blank spike is processed through the entire analytical method including any extraction, digestion or any other preparation procedure. Spike blanks are used to monitor analyte recovery and potential loss during the preparation procedures as well as to validate the calibration of the instrumentation or technique.

Based on the laboratory Reports of Analysis, laboratory sample blank analyses met MECP requirements.

Matrix Spike Samples

Matrix spike samples consist of an aliquot from a randomly chosen sample that is fortified with a known concentration of target analytes. Matrix spike samples are processed through the entire analytical method including any extraction, digestion or any other preparation procedure. The matrix spike sample

is used to evaluate laboratory precision and to evaluate any "matrix effects" that may exist in a sample due to its composition that may affect the recovery of the target analytes. An example is the presence of peat in soils which tends to adsorb organic analytes resulting in a poor matrix spike recovery.

Based on the laboratory Reports of Analysis, recoveries reported for spiked samples/blanks were acceptable, with the exception of the spike recoveries for up to two (2) metals on certificates of analysis 2122544 (cadmium and selenium), 2123129 (boron and lead) and 2151181 (lead) which were below acceptable recover limits. The batches were accepted base on other acceptable quality control data.

Laboratory Replicates

Laboratory replicates (or duplicates) consist of an aliquot from a randomly chosen sample within an analytical batch that is processed through the entire analytical method to evaluate analytical precision and sample homogeneity. The differences between the two sample results are expressed as RPDs.

Based on the laboratory Reports of Analysis, RPDs for laboratory replicate sample analyses met MECP requirements.

Surrogate Recoveries

Surrogates are deuterated analogues or compounds not normally found in nature but behave chemically and physically similar to the target analytes in the analysis. Known surrogate concentrations are added to samples prior to analysis and recoveries calculated and expressed as a percentage. Surrogates are employed to monitor the efficiency of organic extractions, instrument performance and provide within run quality control. The results are reported as percentage recoveries based on the known concentrations added to the sample.

Laboratory surrogate recoveries reported as part of the laboratory Reports of Analysis were found to be within acceptable ranges.

7.5.4 QA/QC Summary

In summary, the laboratory and field QA/QC data indicate that the groundwater data have met the performance criteria of the Analytical Protocol and have not been biased or compromised in any way. The analytical results are thus considered to be representative of the site conditions and can be relied upon in the context of this report and its intended objectives.

8.0 Methane Monitoring Program

A proposed MMP outlining the proposed monitoring program to satisfy the requirements of Condition 4.2.8 of the CPU was submitted to the MECP for its approval on September 2, 2014 (AMEC, 2014d). Communication from the MECP indicating that the City should proceed with the MMP was provided in its letter to the City dated March 20, 2015. The primary objectives of the MMP include, but are not necessarily limited to, addressing the following:

- the influence of seasonal variations on landfill gas concentrations in the vicinity of the former Eastern Landfill and related risk management measures at the Property;
- location and installation details of all boreholes and landfill gas probes included in the program;
- frequency of all sampling and monitoring events;
- trigger levels and contingency activities in case monitoring results show any concentration greater than the PSS that are or may be related to the production of landfill gas; and,
- the correlation between methane measured at the Property and changes in concentration for the chemical parameters identified in Schedule 5, Column 2 – Indicator List for Groundwater and Leachate contained in the Landfill Standards: A Guideline on the Regulatory and Approval Requirements for New or Expanding Landfilling Sites (PIBS 7792e) published by the MOECC and dated January 2012, as it may be amended from time to time.

The MMP shall be overseen by a QP as defined by O. Reg. 153/04.

8.1 Landfill Gas Probe Installations

As per the MMP, a total of ten (10) LFG probes were installed either independently (GP15-4 through GP15-7) or as a nested couplet with groundwater monitoring wells (GP15-1 through GP 15-3 and GP15-8 through GP15-10) to permit monitoring of LFG composition and subsurface pressure, to verify the current levels of methane in the subsoil environment and to identify areas of potential gas impingement. Each LFG probe was constructed as per the details provided in the MMP.

The locations of the LFG probes are shown on Figure 6 while the LFG probe construction details are shown on the stratigraphic and instrumentation logs provided in Appendix C.

8.2 LFG Regulatory Requirements

The concern with methane gas is that it creates an explosion hazard under certain conditions. Methane monitoring is therefore required to ensure that elevated methane concentrations are detected before they present an explosion hazard. The concentration level at which methane has the potential to explode is called the explosive limit. Methane is explosive when mixed with air at concentrations between 5% by volume in air (vol. %) and 15 vol. %. At concentrations below 5 vol. % and above 15 vol. %, methane is not explosive. Therefore, the Lower Explosive Limit (LEL) of methane is 5 vol. % and the Upper Explosive Limit

(UEL) is defined at 15 vol. %. Methane is lighter than air and is likely to dissipate unless trapped inside enclosed spaces.

Ontario Regulation 232/98 – Landfilling Sites, as amended ("O. Reg. 232/98"), provides threshold criteria for landfill gas concentrations at new or expanding landfill sites. While this regulation does not apply to the former Eastern Landfill as it was closed before the regulation came into effect, the criteria outlined in O. Reg. 232/98 provide a basis for assessing the potential impacts due to landfill gas migration. The concentration limits specified in O.Reg. 232/98 are:

- Less than 2.5% methane by volume in the subsurface at the property boundary;
- Less than 1.0% methane by volume in any on-site building, and in the area immediately outside the foundation if the building or structure is accessible to any person or contains electrical equipment or a potential source of ignition; and,
- Less than 0.05% methane by volume in any off-site building, and in the area immediately outside the foundation if the building or structure is accessible to any person or contains electrical equipment or a potential source of ignition.

Guidance on assessment and management of methane gas is provided by the MOECC under *Guideline D-4: Land Use on or Near Landfills and Dumps* (revised April 1994) and Appendix A - Assessing Methane Hazards from Landfill Sites (Procedure D-4-1; November 1987) provided therein. In accordance with the Procedure D-4-1, methane cannot cause an explosion unless it enters an enclosed space and methane accumulates to a concentration above its LEL, and the gas has a high entry rate and high enough accumulation time, such that the methane concentration will be still above the LEL, after dilution by ventilation of the enclosed space. Procedure D-4-1 considers that methane concentrations in air (or in an enclosed space) greater than 20% LEL (equivalent to 1% by volume) may be associated with still higher concentrations, exceeding the LEL. Therefore, methane concentrations greater than 20% LEL warn of conditions which could be potentially hazardous in enclosed structures and gas control systems should be designed to maintain methane concentrations below this level.

8.3 Landfill Gas Monitoring

Landfill gas monitoring was performed on a quarterly basis on February 25th, May 4th, August 26th and December 1st, 2021. Prior to monitoring, the condition of all LFG probes was verified in the field. Each LFG probe was inspected to determine its condition and whether or not it was capable of yielding LFG monitoring data representative of the subsurface conditions (i.e., the stopcock valve was in the closed position to prevent subsurface gas from readily venting via the LFG probe). GP15-8 and GP15-10 could not be monitored during the February monitoring event due to snow cover in their respective areas. Pressure measurements were taken prior to the gas composition measurement by connecting the hose barb on the stopcock to a magnehelic differential pressure gauge and opening the stopcock to record the pressure or vacuum on the pressure gauge.

Gas composition including percent by volume methane (CH_4), oxygen (O_2), carbon dioxide (CO_2) and balance gases and percentage of the lower explosive limit (%LEL) were measured using a Landtec GEM 2000 or 5000 Landfill Gas Monitor. The GEM was calibrated by the equipment provider prior to use in the field. Initial, peak and stabilized gas readings were measured. Initial readings were taken immediately after connecting the monitor to the LFG probe and opening the stopcock. Stabilized readings were taken after the probe had been purged a volume equal to one to three times the combined volume of the probe filter pack.

The results of the LFG monitoring program including LFG composition and subsurface pressure are summarized in Table 5 and are shown on Figure 7. Stable methane concentrations were detected at GP15-2 (0.2 vol. % in February), GP15-4 (0.2 vol. % in February) and GP15-6 (0.2 vol. % in February). Based on the methane concentrations noted above, the Site meets the on-site methane concentrations limits as outlined in O.Reg. 232/98 and the recommended methane alert levels provided in Procedure D-4-1.

8.4 Landfill Gas Data Analyses

The presence of low level initial and stable methane concentrations measured at GP15-6 and GP15-4 reported in February indicate that methane impacts are predominantly confined within the footprint of the former Eastern Landfill. The methane concentrations recorded suggest that any methane present is closely associated with waste deposits and is likely present as pockets trapped beneath less permeable materials. A slight positive pressure was recorded during at least one (1) monitoring event at each LFG probe location with the exception of GP15-5, GP15-8 and GP15-10. The slight positive pressures observed suggests that the subsurface methane is not likely to migrate beyond the immediate areas in which it is encountered. With the exception of a slight methane detection at GP15-2 in February 2021, the lack of consistent detectable methane at the LFG probes surrounding the former Eastern Landfill footprint indicates that the subsurface methane is not likely migrating beyond the boundaries of the former landfill.

9.0 Contingency Measures

Based on the results of the GWMP, MMP and IMP completed in 2021, no contingency measures were deemed necessary and therefore no such measures were implemented at the CPU Property in 2021.

10.0 Site Restoration Activities

A geotechnical investigation including the advancement of seven (7) boreholes was conducted in the vicinity of the East Berm. Four (4) of the boreholes were advanced through the clean soil cap and geotextile demarcation layer overlying the East Berm. The borehole locations were sub-excavated through the clean soil cap and down to the geotextile on October 26, 2021, using a mini excavator. Once the geotextile at the base of the clean soil cap was exposed, it was cut in the shape of an "X" and the tabs pulled back to provide an area to drill through the cap without damaging the geotextile. Once the geotextile was pulled back, the centre of the hole was marked using a stake and the excavation backfilled with the clean soil stockpiled from the excavation in order to allow the drilling contractors to safely work around the borehole locations. Boreholes were then advanced through the clean soil cap into the underlying impacted soils. Drilling operations through the clean soil cap and geotextile were monitored closely in order to ensure the auger did not disturb the geotextile.

Following completion of the drilling activities, reinstatement of the clean soil cap and geotextile was completed on November 16th, 2021. Reinstatement activities included re-excavating the borehole areas down to the geotextile using a mini excavator to expose the geotextile, unfolding the geotextile tabs back into place and then placing a patch of new geotextile over the "X" cuts in the existing geotextile. The specifications of the geotextile used to patch the holes was verified and met the requirements of the CPU. In locations where a groundwater monitoring well was installed, the geotextile was brought up and around and secured to the well's protective casing. Once the geotextile was patched, the hole was backfilled with the clean soil removed to expose the geotextile. Reinstatement of the clean soil cap and geotextile conformed with specifications under the CPU.

Visual inspections undertaken in 2021 noted findings similar to those of reported during previous inspections with respect to several areas of soil erosion identified throughout the South Berm as evidenced by surface rutting, areas of soil washout, bare patches, and areas of down slope sediment accumulation. The observed areas are not considered to result in any increase in the levels of risk to potential receptors at the CPU Property, however, reparations to these areas should be undertaken to prevent continued erosion due to loss of stabilizing vegetation in these areas.

Based on inspections conducted as per the IMP no significant deterioration of the RMM that would result in an increase in potential risk to human health on the CPU property was observed and therefore no immediate site restoration activities were deemed necessary at the CPU Property in 2021.

11.0 Conclusions and Recommendations

The findings and results of the monitoring, sampling and inspection programs carried out at the CPU Property in 2021 to meet the annual reporting requirements are as follows:

- Inspections of the RMM implemented at the CPU Property were conducted in 2021 in accordance with the IMP. The geotechnical investigation which included areas of the East Berm required the advancement of boreholes through the clean soil cover of the East Berm and into the impacted soils beneath. Steps were taken prior to and throughout the drilling activities to protect the integrity of the clean soil cap and underlying geotextile demarcation layer. Once drilling activities were complete the clean soil cap and geotextile were restored to conform with specifications under the CPU.
- Visual inspections undertaken in 2021 in other areas of the Site noted findings similar to those reported during previous inspections with respect to areas of bare soil in high traffic areas of the Site, stressed areas from temporary placement of equipment during entertainment events, as well as several areas of soil erosion identified throughout the South Berm as evidenced by surface rutting, areas of soil washout, bare patches, and areas of down slope sediment accumulation. The observed areas are not considered to result in any increase in the levels of risk to potential receptors at the CPU Property, however, reparations to these areas should be undertaken to prevent continued erosion due to loss of stabilizing vegetation in these areas.
- The 2021 groundwater monitoring and sampling program was conducted on a semi-annual basis in accordance with the GWMP. Results of the groundwater monitoring inferred groundwater flow patterns beneath the CPU Property similar to those observed since inception of the groundwater monitoring program in 2015. Shallow groundwater, beneath the southern half of the CPU property, generally flows to the east and northeast in a quasi-inward radial flow pattern towards a groundwater low in the vicinity of the former McElroy Building. Mounding near the northeast corner of the CPU property results in localized outward radial flow to the west and south and is likely due to leakage from the Rideau Canal migrating to the west within the historic fill materials placed within the former inlet of the Rideau Canal that extends beneath the CPU Property.
- All groundwater samples collected from the monitoring well network located at the CPU property in 2021 reported parameter concentrations below 2011 Table 3 SCS for residential / parkland / institutional property use and coarse textured soil, where established, and for ammonia, chloroform and iron, below the Property Specific Standards (PSS) derived from the Risk Assessment as provided in CPU 0371-8TYQMY.
- Methane concentrations measured at the landfill gas probes located at the CPU Property in 2021 as per the MMP were below the methane concentrations limits as outlined in O.Reg. 232/98 and the recommended methane alert levels provided in Procedure D-4-1: Assessing Methane Hazards from Landfill (MOE, 1987).
- No revisions were deemed necessary to the SMP or the HASP.

Based on the results of the GWMP, MMP and IMP completed in 2021, no contingency measures were deemed necessary at the CPU Property and therefore no such measures or activities were implemented in

2021. Routine inspections did not identify significant deterioration of the RMM that would result in an increase in potential risk to human health at the CPU property and therefore no immediate site restoration activities were deemed necessary at the CPU Property in 2021.

Based on the results of both monitoring programs to date, groundwater quality at the Site continues to meet applicable standards with only a few isolated exceptions reported early on in the program and methane generation is limited to within the limits of the former landfill and at concentrations that are also below applicable trigger criteria. It is Wood's opinion that the GWMP and MMP RMM are no longer required and a formal request to discontinue the programs was submitted to the MECP in 2021.

12.0 Closure

This report was prepared for the exclusive use of Ontario Ministry of the Environment, Conservation and Parks Ottawa District Office, and is intended to provide a 2021 Annual Report - Certificate of Property Use No. 0371-8TYQMY on the property located at 450 Queen Elizabeth Driveway (Part of 945 Bank Street), Ottawa, Ontario at the time of the Site field work performed on the dates set out in this report. Any use which a third party makes of this report, or any reliance on or decisions to be made based on it, are the responsibility of the third party. Should additional parties require reliance on this report, written authorization from Wood will be required. With respect to third parties, Wood has no liability or responsibility for losses of any kind whatsoever, including direct or consequential financial effects on transactions or property values, or requirements for follow-up actions and costs.

The investigation activities undertaken by Wood with respect to this report and any conclusions and/or recommendations made in this report reflect Wood's judgment based on the Site conditions observed at the time of the Site investigations and on information available at the time of preparation of this report. This report has been prepared for specific application to this Site and it is based, in part, upon visual observation of the Site, subsurface investigation at discrete locations and depths, and specific analysis of specific chemical parameters and materials during a specific time interval, all as described in this report. Unless otherwise stated, the findings cannot be extended to previous or future Site conditions, portions of the Site, which were unavailable for direct investigation, subsurface locations which were not investigated directly, or chemical parameters, materials or analysis which were not addressed. Wood has used its professional judgment in analyzing this information and formulating these conclusions.

In evaluating the property, Wood has relied in good faith on information provided by other individuals noted in this report. Wood has assumed that the information provided is factual and accurate. In addition, the findings in this report are based, to a large degree, upon information provided by the current owner/occupant. Wood accepts no responsibility for any deficiency, misstatement or inaccuracy contained in this report as a result of omissions, misinterpretations or fraudulent acts of persons interviewed or contacted.

Wood makes no other representations whatsoever, including those concerning the legal significance of its findings, or as to other legal matters touched on in this report, including, but not limited to, ownership of any property, or the application of any law to the facts set forth herein. With respect to regulatory compliance issues, regulatory statutes are subject to interpretation and change. Such interpretations and regulatory changes should be reviewed with legal counsel.

This Report is also subject to the further Standard Limitations contained in Appendix G.

We trust that the information presented in this report meets your current requirements. Should you have any questions, or concerns, please do not hesitate to contact the undersigned.

Respectfully Submitted,

Wood Environment & Infrastructure Solutions,
A Division of Wood Canada Limited

Notes:

Water Level Data as Recorded During Low-Flow Sampling.

Field Parameters Measured using a YSI 556 Multi-Parameter Water Quality Monitoring Instrument.

mbtoc = Metres Below Top of Casing.

PHC = Petroleum Hydrocarbons.

PAH = Polynuclear Aromatic Hydrocarbons.

Metals = Sb, As, Ba, Be, B, Cd, Ca, Cr, Cr(vi), Co, Cu, Fe, Pb, Mg, Hg, Mo, Ni, Se, Ag, Na, Th, V, Zn.

GWC = General Water Chemistry (pH, alkalinity, ammonia, conductivity, chloride, nitrate, sulphate, biochemical oxygen demand [BOD], chemical oxygen demand [COD], dissolved organic carbon [DOC], total dissolved solids [TDS]).

Notes on Ground Water Analytical Summary Tables

All Units Reported in Micrograms per Litre (µg/L) or Milligrams per Litre (mg/L) as Indicated .

RDL = Laboratory Analytical Method Reporting Detection Limit.

RL = MOE 2011 Analytical Protocol Reporting Limit.

DUP = Quality Assurance/Quality Control Duplicate Sample.

RPD = Relative Percent Difference (Between Primary and Duplicate Samples).

* Denotes Recommended RPD Alert Criterion Exceeded, However, Parameter Concentration Less than 10 Times Laboratory RDL.

PHC = Petroleum Hydrocarbons.

< = Less Than Laboratory Analytical Method Detection Limit.

¯= Not Analyzed or No Published Value.

55	Parameter Concentration May Exceed EPA Table 3 Site Condition Standard for Non-Potable Groundwater Use due to Elevated MDL Reported by the Laboratory.
183	Parameter Concentration Exceeds EPA Table 3 Site Condition Standard for Non-Potable Groundwater Use (Table 3).
2630	Parameter Concentration Exceeds Property Specific Standard as per Certificate of Property Use 0731-8TYQMY.

a = For a Site to Meet This Standard There Must be no Evidence of Free Product, Including but not Limited to, Visible Petroleum Hydrocarbon Film or Sheen Present on Groundwater, Surface Water or in any Groundwater or Surface Water Samples.

b = The Methyl Naphthalene Standards are Applicable to Both 1-Methyl Naphthalene and 2-Methyl Naphthalene, with the Provision that if Both are Detected the Sum of the Two Must not Exceed the Standard.

c = Value adopted from Table A of Guidance for Addressing Chloroform at a Record of Site Condition Property (MOECC, undated).

2011 EPA Standards = Soil, Ground Water and Sediment Standards for Use under Part XV.1 of the Environmental Protection Act, Ontario Ministry of the Environment (MOE), April 15, 2011.

Property Specific Standards as per Certificate of Property Use 0371-8TYQMY issued by the MECP on November 25, 2013.

Table 4a. Summary of Groundwater Analyses - Spring 2021

Notes on Landfill Gas Monitoring Results

Relative pressure readings for October 28, 2015 monitoring taken on November 17, 2015.

masl = Metres above sea level.

mbgs = Metres below ground surface.

LEL = Lower Exposive Limit

Monitoring performed using a Landtec GEM 2000 or 5000 Landfill Gas Analyzer.

>>> = Methane over Detectable Range of the Instrument.

2.5	Percent Methane by Volume Exceeds MOE Regulation 232/98 for Landfill Property Boundary Subsurface.
1	Percent Methane by Volume Exceeds MOE Regulation 232/98 for Landfill On-Site Building or Foundation.
0.05	Percent Methane by Volume Exceeds MOE Regulation 232/98 for Landfill Off-Site Building or Foundation.

Table 5 - Historical Landfill Gas Monitoring Data

Monitor ID	MTM Coordinates		Ground Surface Elevation (masl)	Screen Interval (mbgs)	Geologic Media Intersected by Screen	Monitoring Date	In-Situ Measurements							Comments (Status of Landfill Gas Probes)
	Easting	Northing					Methane (CH_4)			Carbon Dioxide (%)	Oxygen (%)	Balance Gases (%)	Relative Pressure (Inches of Water)	
							% v/v		% LEL					
							Initial and/or Peak	Long Term and/or Stable	Long Term and/or Stable	Long Term and/or Stable	Long Term and/or Stable	Long Term and/or Stable		
GP15-1	368878.435	5029083.949	65.043	1.52 - 3.05	Overburden	25-Feb-21	0.0	0.0	0.0	3.6	14.2	82.1	0.0	Good Condition

Appendix A
Certificate of Property Use
(Available Upon Request)

Appendix B
Risk Management Measures Inspection Logs

Inspection Log
Risk Management Measures
Lansdowne Park – Urban Park

This log form is to be used to document inspections of the Risk Management Measures (RMM) in place at the East and South Berms, former Eastern Landfill and former McElroy Building to mitigate potentially unacceptable health risks associated with the exposure to contaminated soil as required by Certificate of Property Use (CPU) 0371-8TYQMY. Routine inspections are to be carried out during the spring and fall of each year following the spring thaw and prior to the winter ground frost and snow cover. Weather, event and incident inspections are to be carried out subsequent to the appropriate trigger initiating the need for inspection. Inspections shall be carried out as needed until such time that the RMM are no longer required at the site.

1) General Information

Inspection Date (mm/dd/yy): 05/19/21 Inspected by: Jason Taylor

Time in (hh/mm): 13:00 Time out (hh/mm): 14:30

Weather (current): Sunny 30°C

Precipitation in last 24 hours? Yes ☐ No ☒ Rainfall quantity if available _____ mm

2) Inspection Type

Routine (semi-annual) ☐ Spring ☒ Fall ☐ (if semi-annual, proceed to Section 4)

Construction (provide details below) ☐ Weather-related (provide details below) ☐

Event-specific (provide details below) ☐ Incident-related (provide details below) ☐

3) Location of Event or Incident (Check all that apply)

East Berm	☒	South Berm	☒
Shuttle Loop / Eastern Landfill	☒	Heirloom Orchard / Eastern Landfill	☒
East Court / Eastern Landfill	☒	Skating Court / Eastern Landfill	☒
Skate Park / Eastern Landfill	☒	Water Jet Plaza / Eastern Landfill	☒
Children's Garden / Eastern Landfill	☒	Great Lawn / Eastern Landfill	☒
Former McElroy Building	☒		

Details of event or incident: Routine Spring inspection.

4) East Berm

Are there any areas of worn or stressed vegetation?	Yes	☒	No	☐
Are there any areas of bare or exposed soil?	Yes	☒	No	☐
Are there any areas of uneven settlement?	Yes	☒	No	☐
Are any shear or tension cracks present on any sloped areas?	Yes	☐	No	☒
Do roads/pathways show evidence of uneven settlement, cracking or buckling?	Yes	☐	No	☒
Is there any evidence of soil erosion, transport and sedimentation?	Yes	☒	No	☐
Has the non-woven geotextile been exposed in any area?	Yes	☐	No	☒

Other observations: Areas of bare soil were observed in high traffic areas of the berm including flat areas At the top of the berm and around the Art Screen. An area of soil erosion and transport was observed at the east side of the berm near the entrance of the pedestrian pathway.

5) South Berm

Are there any areas of worn or stressed vegetation?	Yes	☒	No	☐
Are there any areas of bare or exposed soil?	Yes	☒	No	☐
Are there any areas of uneven settlement?	Yes	☐	No	☒
Are any shear or tension cracks present on any sloped areas?	Yes	☐	No	☒
Do roads/pathways show evidence of uneven settlement, cracking or buckling?	Yes	☐	No	☒
Is there any evidence of soil erosion, transport and sedimentation?	Yes	☒	No	☐
Has the non-woven geotextile been exposed in any area?	Yes	☐	No	☒

Other observations: Areas of exposed soil and soil transport were observed throughout the south berm, particularly in areas with steep slopes. Bare soil was observed on either side of pathways on the berm, inferred to be from pedestrian and vehicular traffic.

6) South Drainage Swales

The south drainage swales are located on the north and south side of the fire access route at the toe of the South Berm

Are there any areas of worn or stressed vegetation?	Yes	☒	No	☐
Are there any areas of bare or exposed soil?	Yes	☒	No	☐
Are there any areas of uneven settlement?	Yes	☐	No	☒
Are any shear or tension cracks present on any sloped areas?	Yes	☐	No	☒
Is there any evidence of soil erosion, transport and sedimentation?	Yes	☒	No	☐
Has the non-woven geotextile been exposed in any area?	Yes	☐	No	☒

Other observations: Road base material as well as portions of the northern slope of the swale were observed to be eroding into the swale.

7) Former Eastern Landfill

The former Eastern Landfill includes the Heirloom Orchard, Skating Court, Skate Park, Children's Garden, Water Jet Plaza, and the northeast portion of the Great Lawn.

Are there any areas of worn or stressed vegetation?	Yes	☒	No	☐
Are there any areas of bare or exposed soil?	Yes	☒	No	☐
Are there any areas of uneven settlement?	Yes	☐	No	☒
Do roads/pathways show evidence of uneven settlement, cracking or buckling?	Yes	☐	No	☒
Is there any evidence of soil erosion, transport and sedimentation?	Yes	☐	No	☒
Has the non-woven geotextile been exposed in any area?	Yes	☐	No	☒

Other observations: Several small areas of bare soil and stressed vegetation were observed in high traffic areas around the ice rink and children's Garden/Skate Park area. Areas of bare soil and stressed vegetation were also observed in high traffic areas north of the ring road south of the Water Plaza and south of the ring road at the north end of the Great Lawn.

8) Former McElroy Building

Are there any areas of worn or stressed vegetation?	Yes	☒	No	☐
Are there any areas of bare or exposed soil?	Yes	☒	No	☐
Are there any areas of uneven settlement?	Yes	☐	No	☒
Do roads/pathways show evidence of uneven settlement, cracking or buckling?	Yes	☐	No	☒
Is there any evidence of soil erosion, transport and sedimentation?	Yes	☐	No	☒
Has the non-woven geotextile been exposed in any area?	Yes	☐	No	☒

Other observations: A large portion of this area was resurfaced with granular materials in 2019. Bare soil and tire ruts were observed in areas adjacent the granular covered area. Temporary stockpiles of topsoil and mulch were observed north of the gravel covered area with areas of bare soil where stockpiled material has been removed.

9) East Perimeter Drainage Swale

The east perimeter drainage is located along the east property extending from the northeast entrance from Queen Elizabeth Driveway to the southeast corner of the Great Lawn

Are there any areas of worn or stressed vegetation?	Yes	☒	No	☐
Are there any areas of bare or exposed soil?	Yes	☒	No	☐
Are there any areas of uneven settlement?	Yes	☐	No	☒
Are any shear or tension cracks present on any sloped areas?	Yes	☐	No	☒
Is there any evidence of soil erosion, transport and sedimentation?	Yes	☐	No	☒
Has the non-woven geotextile been exposed in any area?	Yes	☐	No	☒

Other observations: In 2019, a large portion of the swale south of the Water Plaza, was resurfaced with granular materials. North of the Water Plaza, conditions were similar to those previously observed with some areas of bare soil overlying the trench excavated to run electrical conduits to the sign at the entrance to the Site from Queen Elizabeth Driveway.

Inspection Log
Risk Management Measures
Lansdowne Park – Urban Park

This log form is to be used to document inspections of the Risk Management Measures (RMM) in place at the East and South Berms, former Eastern Landfill and former McElroy Building to mitigate potentially unacceptable health risks associated with the exposure to contaminated soil as required by Certificate of Property Use (CPU) 0371-8TYQMY. Routine inspections are to be carried out during the spring and fall of each year following the spring thaw and prior to the winter ground frost and snow cover. Weather, event and incident inspections are to be carried out subsequent to the appropriate trigger initiating the need for inspection. Inspections shall be carried out as needed until such time that the RMM are no longer required at the site.

1) General Information

Inspection Date (mm/dd/yy): 09/30/21 Inspected by: Jason Taylor

Time in (hh/mm): 9:30 Time out (hh/mm): 11:00

Weather (current): Sunny 15°C

Precipitation in last 24 hours? Yes ☐ No ☒ Rainfall quantity if available _____ mm

2) Inspection Type

Routine (semi-annual) ☒ Spring ☐ Fall ☒ (if semi-annual, proceed to Section 4)

Construction (provide details below) ☐ Weather-related (provide details below) ☒

Event-specific (provide details below) ☒ Incident-related (provide details below) ☐

3) Location of Event or Incident (Check all that apply)

East Berm	☒	South Berm	☒
Shuttle Loop / Eastern Landfill	☒	Heirloom Orchard / Eastern Landfill	☒
East Court / Eastern Landfill	☒	Skating Court / Eastern Landfill	☒
Skate Park / Eastern Landfill	☒	Water Jet Plaza / Eastern Landfill	☒
Children's Garden / Eastern Landfill	☒	Great Lawn / Eastern Landfill	☒
Former McElroy Building	☒		

Details of event or incident: Fall inspection following the CityFolk music festival (September 16th-18th), the Bluesfest music festival (September 23rd-25th) and a rainfall event of 31.8 mm on September 22nd.

4) East Berm

Are there any areas of worn or stressed vegetation?	Yes	☒	No	☐
Are there any areas of bare or exposed soil?	Yes	☒	No	☐
Are there any areas of uneven settlement?	Yes	☒	No	☐
Are any shear or tension cracks present on any sloped areas?	Yes	☐	No	☒
Do roads/pathways show evidence of uneven settlement, cracking or buckling?	Yes	☐	No	☒
Is there any evidence of soil erosion, transport and sedimentation?	Yes	☒	No	☐
Has the non-woven geotextile been exposed in any area?	Yes	☐	No	☒

Other observations: Areas of bare soil were observed in high traffic areas of the berm primarily at the top of the berm.

5) South Berm

Are there any areas of worn or stressed vegetation?	Yes	☒	No	☐
Are there any areas of bare or exposed soil?	Yes	☒	No	☐
Are there any areas of uneven settlement?	Yes	☐	No	☒
Are any shear or tension cracks present on any sloped areas?	Yes	☐	No	☒
Do roads/pathways show evidence of uneven settlement, cracking or buckling?	Yes	☐	No	☒
Is there any evidence of soil erosion, transport and sedimentation?	Yes	☒	No	☐
Has the non-woven geotextile been exposed in any area?	Yes	☐	No	☒

Other observations: Areas of exposed soil and soil transport were observed throughout the south berm, particularly in areas with steep slopes. Bare soil was observed on either side of pathways on the berm, inferred to be from pedestrian and vehicular traffic.

6) South Drainage Swales

The south drainage swales are located on the north and south side of the fire access route at the toe of the South Berm

Are there any areas of worn or stressed vegetation?	Yes	☒	No	☐
Are there any areas of bare or exposed soil?	Yes	☒	No	☐
Are there any areas of uneven settlement?	Yes	☐	No	☒
Are any shear or tension cracks present on any sloped areas?	Yes	☐	No	☒
Is there any evidence of soil erosion, transport and sedimentation?	Yes	☒	No	☐
Has the non-woven geotextile been exposed in any area?	Yes	☐	No	☒

Other observations: Road base material as well as portions of the northern slope of the swale were observed to be eroding into the swale.

7) Former Eastern Landfill

The former Eastern Landfill includes the Heirloom Orchard, Skating Court, Skate Park, Children's Garden, Water Jet Plaza, and the northeast portion of the Great Lawn.

Are there any areas of worn or stressed vegetation?	Yes	☒	No	☐
Are there any areas of bare or exposed soil?	Yes	☒	No	☐
Are there any areas of uneven settlement?	Yes	☐	No	☒
Do roads/pathways show evidence of uneven settlement, cracking or buckling?	Yes	☐	No	☒
Is there any evidence of soil erosion, transport and sedimentation?	Yes	☐	No	☒
Has the non-woven geotextile been exposed in any area?	Yes	☐	No	☒

Other observations: Several small areas of bare soil and stressed vegetation were observed in high traffic areas around the ice rink and children's Garden/Skate Park area. Areas of bare soil and stressed vegetation were also observed in areas of the Great Lawn and south of the Water Plaza from use during the CityFolk and Bluesfest music festivals. At the time of the inspection Saunders Farm was setting up "The Sawmill" attraction on the Great Lawn which will be disturbing a large area of the lawn.

8) Former McElroy Building

Are there any areas of worn or stressed vegetation?	Yes	☒	No	☐
Are there any areas of bare or exposed soil?	Yes	☒	No	☐
Are there any areas of uneven settlement?	Yes	☐	No	☒
Do roads/pathways show evidence of uneven settlement, cracking or buckling?	Yes	☐	No	☒
Is there any evidence of soil erosion, transport and sedimentation?	Yes	☐	No	☒
Has the non-woven geotextile been exposed in any area?	Yes	☐	No	☒

Other observations: A large portion of this area was resurfaced with granular materials in 2019. Bare soil and tire ruts were observed in areas adjacent the granular covered area. Base soil was observed in areas where stockpiles of topsoil and mulch were observed during the Spring 2021 inspection.

9) East Perimeter Drainage Swale

The east perimeter drainage is located along the east property extending from the northeast entrance from Queen Elizabeth Driveway to the southeast corner of the Great Lawn

Are there any areas of worn or stressed vegetation?	Yes	☒	No	☐
Are there any areas of bare or exposed soil?	Yes	☒	No	☐
Are there any areas of uneven settlement?	Yes	☐	No	☒
Are any shear or tension cracks present on any sloped areas?	Yes	☐	No	☒
Is there any evidence of soil erosion, transport and sedimentation?	Yes	☐	No	☒
Has the non-woven geotextile been exposed in any area?	Yes	☐	No	☒

Other observations: In 2019, a large portion of the swale south of the Water Plaza, was resurfaced with granular materials. North of the Water Plaza, conditions were similar to those previously observed with some areas of bare soil overlying the trench excavated to run electrical conduits to the sign at the entrance to the Site from Queen Elizabeth Driveway.

Attention: Michael Bottigoni
Senior Vice President Construction

Dear Mr. Bottigoni;

RE: Risk Management Measure Inspections
Certificate of Property Use (CPU 0371-8TYQMY)
Lansdowne Park, Urban Park (Zone C)
450 Queen Elizabeth Drive (Part of 945 Bank Street),
Ottawa, Ontario

Wood Environment & Infrastructure Solutions, a division of Wood Canada Limited ("Wood"), was retained by Trinity Development Group Inc. in its capacity as agent for Lansdowne Retail Limited Partners ("Trinity") to carry out inspections during a recent geotechnical investigation at Lansdowne Park – Urban Park (Zone C) property located at 450 Queen Elizabeth Driveway (part of 945 Bank Street) in Ottawa, Ontario (hereinafter referred to as the "Site"). The inspections were undertaken to ensure the geotechnical investigation was conducted in a way to preserve and protect the Risk Management Measure (RMM) implemented at the Site as mandated under the Certificate of Property Use (CPU) No. 0371-8TYQMY, including the clean soil cap and underlying geotextile overlying the East Berm. Inspections were also completed during reinstatement activities to ensure they were conducted in accordance with the requirements set forth in the CPU.

The geotechnical investigation was conducted by Paterson Group Inc. ("Paterson") and included the advancement of seven (7) boreholes in the vicinity of the East Berm four (4) of which were advanced through the clean soil cap and geotextile overlying the East Berm. Two (2) borehole locations were instrumented with groundwater monitoring wells including one (1) location within the East Berm footprint. A plan depicting the borehole and groundwater monitoring well locations is provided in Figure 1. Proposed borehole locations were sub-excavated through the clean soil cap and down to the geotextile on October 26, 2021, using a mini excavator. Once the geotextile at the base of the clean soil cap was exposed, it was cut and pulled back to provide an area to drill through the cap without damaging the geotextile. Once the geotextile was pulled back, the centre of the hole was marked using a stake and

the excavation backfilled with the clean soil stockpiled from the excavation in order to allow the drilling contractors to safely work around the borehole locations.

Boreholes located on the East Berm were advanced by George Downing Estate Drilling Ltd. ("Downing") between October 26th and November 12th, 2021. Boreholes were advanced through the clean soil cap into the underlying impacted soils. Drilling operations through the clean soil cap and geotextile were monitored closely in order to ensure the auger did not disturb the geotextile. Paterson was informed that soil beneath the geotextile layer was to be treated as contaminated soil. Any excess drill cuttings from beneath the geotextile layer were to be segregated and placed in drums to be disposed of at a licensed landfill.

Following the drilling activities, reinstatement of the clean soil cap and geotextile was completed by Paterson on November 16th, 2021. Reinstatement activities included re-excavating the borehole areas down to the geotextile using a mini excavator to expose the geotextile, folding the geotextile back down and then placing a patch of new geotextile over the cuts in the existing geotextile. The specifications of the geotextile used to patch the holes was verified and met the requirements of the CPU. In locations where a groundwater monitoring well was installed, the geotextile was brought up and around the well's protective casing. Once the geotextile was patched the hole was backfilled with the clean soil removed to expose the geotextile. Reinstatement of the clean soil cap and geotextile conformed with specifications under the CPU.

A photo log is enclosed showing the general steps of the investigation and reinstatement activities.

We trust the above information is satisfactory. If you have any questions, please do not hesitate to contact the undersigned.

Sincerely,

Wood Environment & Infrastructure Solutions,
A Division of Wood Canada Limited

Jason Taylor, B.SC. (Hon)
Senior Environmental Scientist

Kevin D. Hicks, M.Sc., P.Geo., QP_{ESA}

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable
ND: Not Detected
MDL: Method Detection Limit
Source Result: Data used as source for matrix and duplicate samples
%REC: Percent recovery.
RPD: Relative percent difference.
NC: Not Calculated

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.
- When reported, data for F4G has been processed using a silica gel cleanup.

Qualifier Notes:

QC Qualifiers :

QM-07 : The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on other acceptable QC.

Sample Data Revisions

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable
ND: Not Detected
MDL: Method Detection Limit
Source Result: Data used as source for matrix and duplicate samples
%REC: Percent recovery.
RPD: Relative percent difference.
NC: Not Calculated

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.
- When reported, data for F4G has been processed using a silica gel cleanup.

Qualifier Notes:

QC Qualifiers :

QM-07 : The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on other acceptable QC.

QS-02 : Spike level outside of control limits. Analysis batch accepted based on other QC included in the batch.

Sample Data Revisions

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable
ND: Not Detected
MDL: Method Detection Limit
Source Result: Data used as source for matrix and duplicate samples
%REC: Percent recovery.
RPD: Relative percent difference.
NC: Not Calculated

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.
- When reported, data for F4G has been processed using a silica gel cleanup.

Qualifier Notes:

Login Qualifiers :

Container and COC sample IDs don't match - COC reads: "MW.." Bottle reads: "MW15.."

Applies to samples: MW15-1, MW15-2, MW15-8, MW15-12

Sample Data Revisions

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable
ND: Not Detected
MDL: Method Detection Limit
Source Result: Data used as source for matrix and duplicate samples
%REC: Percent recovery.
RPD: Relative percent difference.
NC: Not Calculated

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.
- When reported, data for F4G has been processed using a silica gel cleanup.

Project: TZ10100106/Lansdowne Park
Custody: 63985

Report Date: 17-Dec-2021
Order Date: 8-Dec-2021

Order #: 2150402

This Certificate of Analysis contains analytical data applicable to the following samples as submitted:

Paracel ID	Client ID
2150402-01	MW15-3
2150402-02	MW15-5
2150402-03	MW15-7
2150402-04	MW15-10
2150402-05	MW15-11
2150402-06	DUP-2
2150402-07	TRIP BLANK

Approved By:

Dale Robertson, BSc
Laboratory Director

Analysis Summary Table

Analysis	Method Reference/Description	Extraction Date	Analysis Date
Alkalinity, total to pH 4.5	EPA 310.1 - Titration to pH 4.5	13-Dec-21	13-Dec-21
Ammonia, as N	EPA 351.2 - Auto Colour	15-Dec-21	15-Dec-21
Anions	EPA 300.1 - IC	10-Dec-21	10-Dec-21
Biochemical Oxygen Demand	SM 5210B - DO Probe	10-Dec-21	15-Dec-21
Chemical Oxygen Demand	EPA 410.1 - Digestion, Colourimetric	10-Dec-21	10-Dec-21
Chloroform	EPA 624 - P&T GC-MS	10-Dec-21	11-Dec-21
Chromium, hexavalent - water	MOE E3056 - colourimetric	10-Dec-21	10-Dec-21
Hardness	Hardness as CaCO3	13-Dec-21	13-Dec-21
Conductivity	EPA 9050A- probe @25 °C	13-Dec-21	13-Dec-21
Dissolved Organic Carbon	MOE E3247B - Combustion IR, filtration	13-Dec-21	13-Dec-21
Mercury by CVAA	EPA 245.2 - Cold Vapour AA	13-Dec-21	14-Dec-21
Metals, ICP-MS	EPA 200.8 - ICP-MS	13-Dec-21	13-Dec-21
pH	EPA 150.1 - pH probe @25 °C	13-Dec-21	13-Dec-21
PHC F1	CWS Tier 1 - P&T GC-FID	10-Dec-21	11-Dec-21
PHCs F2 to F4	CWS Tier 1 - GC-FID, extraction	13-Dec-21	14-Dec-21
Phosphorus, total, water	EPA 365.4 - Auto Colour, digestion	13-Dec-21	14-Dec-21
REG 153: PAHs by GC-MS	EPA 625 - GC-MS, extraction	15-Dec-21	16-Dec-21
Total Dissolved Solids	SM 2540C - gravimetric, filtration	13-Dec-21	14-Dec-21
Total Kjeldahl Nitrogen	EPA 351.2 - Auto Colour, digestion	13-Dec-21	13-Dec-21

Sample Data Revisions

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable
ND: Not Detected
MDL: Method Detection Limit
Source Result: Data used as source for matrix and duplicate samples
%REC: Percent recovery.
RPD: Relative percent difference.
NC: Not Calculated

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.
- When reported, data for F4G has been processed using a silica gel cleanup.

Qualifier Notes:

Login Qualifiers :

Container(s) - Labeled improperly/insufficient information - PAH bottle is missing the sample ID

Applies to samples: MW15-4

QC Qualifiers :

Sample Data Revisions

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable
ND: Not Detected
MDL: Method Detection Limit
Source Result: Data used as source for matrix and duplicate samples
%REC: Percent recovery.
RPD: Relative percent difference.
NC: Not Calculated

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.
- When reported, data for F4G has been processed using a silica gel cleanup.

Qualifier Notes:

QC Qualifiers :

QM-07 : The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on other acceptable QC.

Sample Data Revisions

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable
ND: Not Detected
MDL: Method Detection Limit
Source Result: Data used as source for matrix and duplicate samples
%REC: Percent recovery.
RPD: Relative percent difference.
NC: Not Calculated

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.
- When reported, data for F4G has been processed using a silica gel cleanup.

Appendix E
Historical Groundwater Quality Data

Notes on Ground Water Analytical Summary Tables

All Units Reported in Micrograms per Litre (µg/L) or Milligrams per Litre (mg/L) as Indicated .

RDL = Laboratory Analytical Method Reporting Detection Limit.

RL = MOE 2011 Analytical Protocol Reporting Limit.

DUP = Quality Assurance/Quality Control Duplicate Sample.

RPD = Relative Percent Difference (Between Primary and Duplicate Samples).

* Denotes Recommended RPD Alert Criterion Exceeded, However, Parameter Concentration Less than 10 Times Laboratory RDL.

PHC = Petroleum Hydrocarbons.

< = Less Than Laboratory Analytical Method Detection Limit.

¯= Not Analyzed or No Published Value.

55	Parameter Concentration May Exceed EPA Table 3 Site Condition Standard for Non-Potable Groundwater Use due to Elevated MDL Reported by the Laboratory.
183	Parameter Concentration Exceeds EPA Table 3 Site Condition Standard for Non-Potable Groundwater Use (Table 3).
2630	Parameter Concentration Exceeds Property Specific Standard as per Certificate of Property Use 0731-8TYQMY.

a = For a Site to Meet This Standard There Must be no Evidence of Free Product, Including but not Limited to, Visible Petroleum Hydrocarbon Film or Sheen Present on Groundwater, Surface Water or in any Groundwater or Surface Water Samples.

b = The Methyl Naphthalene Standards are Applicable to Both 1-Methyl Naphthalene and 2-Methyl Naphthalene, with the Provision that if Both are Detected the Sum of the Two Must not Exceed the Standard.

c = Value adopted from Table A of Guidance for Addressing Chloroform at a Record of Site Condition Property (MOECC, undated).

2011 EPA Standards = Soil, Ground Water and Sediment Standards for Use under Part XV.1 of the Environmental Protection Act, Ontario Ministry of the Environment (MOE), April 15, 2011.

Property Specific Standards as per Certificate of Property Use 0371-8TYQMY issued by the MECP on November 25, 2013.

Appendix F
Historical Landfill Gas Monitoring Data

Notes on Landfill Gas Monitoring Results

Relative pressure readings for October 28, 2015 monitoring taken on November 17, 2015.

masl = Metres above sea level.

mbgs = Metres below ground surface.

LEL = Lower Exposive Limit

Monitoring performed using a Landtec GEM 2000 or 5000 Landfill Gas Analyzer.

>>> = Methane over Detectable Range of the Instrument.

2.5	Percent Methane by Volume Exceeds MOE Regulation 232/98 for Landfill Property Boundary Subsurface.
1	Percent Methane by Volume Exceeds MOE Regulation 232/98 for Landfill On-Site Building or Foundation.
0.05	Percent Methane by Volume Exceeds MOE Regulation 232/98 for Landfill Off-Site Building or Foundation.

Appendix G
Limitations

Limitations

1. The work performed in the preparation of this report and the conclusions presented are subject to the following:
    (a) The Standard Terms and Conditions which form a part of our Professional Services Contract;
    (b) The Scope of Services;
    (c) Time and Budgetary limitations as described in our Contract; and,
    (d) The Limitations stated herein.
2. No other warranties or representations, either expressed or implied, are made as to the professional services provided under the terms of our Contract, or the conclusions presented.
3. The conclusions presented in this report were based, in part, on visual observations of the site and attendant structures. Our conclusions cannot and are not extended to include those portions of the site or structures which were not reasonably available, in Wood's opinion, for direct observation.
4. The environmental conditions at the site were assessed, within the limitations set out above, having due regard for applicable environmental regulations as of the date of the inspection. A review of compliance by past owners or occupants of the site with any applicable local, provincial or federal by-laws, orders-in-council, legislative enactments and regulations was not performed.
5. The site history research included obtaining information from third parties and employees or agents of the owner. No attempt has been made to verify the accuracy of any information provided, unless specifically noted in our report.
6. Where testing was performed, it was carried out in accordance with the terms of our contract providing for testing. Other substances, or different quantities of substances testing for, may be present on site and may be revealed by different of other testing not provided for in our contract.
7. Because of the limitations referred to above, different environmental conditions from those stated in our report may exist. Should such different conditions be encountered, Wood must be notified in order that it may determine if modifications to the conclusions in the report are necessary.
8. The utilization of Wood's services during the implementation of any remedial measures will allow Wood to observe compliance with the conclusions and recommendations contained in the report. Wood's involvement will also allow for changes to be made as necessary to suit field conditions as they are encountered.
9. This report is for the sole use of the party to whom it is addressed unless expressly stated otherwise in the report or contract. Any use which any third party makes of the report, in whole or in part, or any reliance thereon, or decisions made based on any information of conclusions in the report, is the sole responsibility of such third party. Wood accepts no responsibility whatsoever for damages or loss of any nature or kind suffered by any such third party as a result of actions taken or not taken or decisions made in reliance on the report or anything set out therein.
10. This report is not to be given over to any third party for any purpose whatsoever without the written permission of Wood.
11. Provided that the report is still reliable, and less than 12 months old, Wood will issue a third-party reliance letter to parties client identifies in writing, upon payment of the then current fee for such letters. All third parties relying on Wood's report, by such reliance agree to be bound by our proposal and Wood's standard reliance letter. Wood's standard reliance letter indicates that in no event shall Wood be liable for any damages, howsoever arising, relating to third-party reliance on Wood's report. No reliance by any party is permitted without such agreement.
