Study Objectives

The objective of this functional design study is to review and evaluate the alternative design choices for the reconstruction of the streets, including:

- Undertaking a transportation study to establish the lane arrangements, including turning lanes at intersections;
- Confirming on-street parking and loading solutions;
- Determining sidewalk width, cycling and transit requirements and solutions;
- Understanding the below-grade services and utilities that might affect street renewal choices;
- Identifying potential locations for public places, enhanced streetscape areas and public art; and
- Developing, in general terms, potential streetscaping themes and directions that can be addressed during the subsequent detailed design phase.
